                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CAML-interactor (TACI) protein (see AAW75783). TACI is a lymphocyte receptor protein that is involved in the calcium activation pathway. It is normally present in B-lymphocytes, and to a much lesser extent in immature T-lymphocytes, and can therefore be targetted to specifically regulate B cell responses without affecting T cell activity. The extracellular domain of TACI functions as a binding slite for a ligand that stimulates the activation of the cell by inducing the binding of the C-terminal portion (see AAW75784) of TACI to the N-terminal domain of CAML. A recombinant form of the extracellular portion of TACI acts as a dominant-negative or blocking agent and acts to suppress the immune system. It can be used to treat or prevent autoimmune disease, graft rejection or graft versus host disease. The extracellular region is also used in a claimed method for identifying a ligand for TACI, in which binding of a candidate molecule is determined by detecting cellular activation of the AP-1, CAMP on NF-KB pathway, of NF-AT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method for inhibiting TACI (transmembrane CC activator and intracellular CAML interactor) and/or B cell maturation CC protein (BCMA) activity in a mammal. The method comprises administering CC a specific binding partner for APRII (G70, a tumour necrosis factor-TWNF cc family ligand), having the consensus region of TACI, BCMA, or the TACI/C BCMA extracellular consensus sequence, but not the extracellular region of TACI or BCMA. The method is useful for inhibiting activity of TACI/C C and/or BCMA in a mammal which is useful for treating B-cell or T-cell CC lymphoproliferative disorders, one or more solid tumours such as lung, CC gastrointestinal, pancreatic or prostate tumour. APRII, BCMA and TACI/C C antagonists are useful for treating inflammation and immune function CC diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic CC dermatitis, respiratory allergic disease (asthma, hypersensitivity lung CC (Crohn's disease, colitis), scleroderma, autoimune disease (multiple CC sclerosis, rheumatoid arthritis, systemic lupus erythematosus), fungal, bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer with leucocyte infiltration of the skin or organs. The present sequence

The method is useful for treating pathological conditions or diseases associated with increased TALL-1 and APRIL expression or activity. TALL-1 and APRIL antagonists are used to block the interaction between APRIL and TALL-1 with TACI or BCMA.

                                                                                                                                                                                                                                                                   is normally present in B-lymphocytes, and to a much lesser extent chi immature T-lymphocytes, and can therefore be targetted to specifically regulate B cell responses without affecting T cell correctivity. TACI CDNA (seev57328) was isolated from a B-lymphocyte chNA library using a yeast two-hybrid assay. Also claimed are the C-terminal (see AAW75784) and N-terminal (see AAW75785) fragments of TACI, recombinant DNA constructs, unicellular hosts, and cantibodies to TACI protein. Methods are claimed for identifying a ligand for TACI and for identifying immunosuppressive drugs that celectively block the action of B lymphocytes without affecting constructed to increase immune system activity, e.g. for treating infections or cancers. It can be blocked to provide immunosuppression, e.g. for treating autoimmune and inflammatory conditions such as immune complexinduced vasculitis, glomerulonephritis, haemolytic anaemia, myasthenia gravis, type II collagen-induced arthritis, experimental allergic and hyperacute xenograft rejection, rheumatoid arthritis, experimental consideration or cancer or consideration cancer cancer cancer cancer cancer cancer ca

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents the human neutrokine-alpha binding (NAR) protein designated TR17. TR17 has cytostatic, immunosuppressive, noutropic, neuroprotective, antiviral, antiallergic, hepatotropic, antidiabetic, antiinflammatory, antiviral, antiallergic, hepatotropic, antidiabetic, antiinflammatory, antiviral, Transition of the same useful for treating and diagnosing immunodeficiency disorders and autoimmune disorders. The TR17 polypeptides, polynucleotides, antibodies, agonists are used for treating various other diseases defined in the specification and as research tools for studying the phenotypic effects that result from inhibiting TR17/TR17 ligand interactions on various cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 1; Fig 1; 398pp;

                                                  The present sequence represents a human transmembrane activator and CC CAML-interactor (TACI) receptor. TACI is a tumour necrosis factor (TNF) CC ceptor. The extracellular domains of BR43x2 (an isoform of TACI), TACI CC or BCMA (a related B cell protein) receptor contain a cystein erich (CC domain, and are used for inhibiting ztnf4 activity. Ztnf4 is a TNF CC ligand. They may also be used for inhibiting BR43x2, TACI or BCMA CC receptor-ligand engagement associated with activated or resting B CC lymphocytes, effector T-cells, or with antibody production. The CC antibody production is associated with an autoimmune disease selected cf from systemic lupus crythematosus, myasthenia gravis, multiple sclerosis and rheumatoid arthritis. The ztnf4 activity and BR43x2, TACI or BCMA creceptor-ligand engagement is associated with asthma, bronchitis, CC emphysema, end stage renal failure, glomerulonephritis, vasculitis, comphritis, pyelonephritis, renal neoplasms, multiple myelomas, lymphomas, comphritis, pyelonephritis, renal neoplasms, multiple myelomas, lymphomas, light chain neuropathy, amyloidosis, moderating immune response, communosuppression, graft rejection, graft versus host disease, joint conflammation, insulin dependent disbects mellitus, Crohn's disease, joint path, swelling, anaemia, or septic shock. BR43x2, TACI, and BCMA conflammation, renal artery stenosis, or occlusion, and

                                                       The invention relates to methods of using one or more agonists or antagonists to modulate the activity of the members of TNF (tumour necrosis factor) especially TALL-1, APRIL and TNF receptor (TNFR) e.g. TACI or BCMA. The method is useful for treating pathological conditions or diseases associated with increased TALL-1 and APRIL expression or activity. TALL-1 and APRIL antagonists are used to block the interaction between APRIL and TALL-1 with TACI or BCMA. They are useful for treating a mammal suffering from cancer such as leukaemia, lymphoma, myeloma, cancers of lung and colon and autoimmune diseases e.g. rheumatoid arthrifts, multiple sclerosis, psociasis and lupus erythematosus. The present sequence is human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Best
                     The present sequence is a human tumour necrosis factor receptor (TACI) protein. TACI (Transmembrane activator and calcium-signal modulating cyclophilin ligand (CAML)-interactor) forms a complex with neutrokine alpha polypeptide (TACI-Ligand). The antagonist or agonist of TACI/TACI-L complex is useful for modulating an intracellular signalling cascade mediated by TACI/TACI-L complex. Antagonists of TACI/TACI-L complex are used to inhibit the interaction between TACI and TACI-L for therapeutic purposes to treat tumour and tumour metastasis and to combat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tumour necrosis factor receptor; TNF; autoimmune disease; diabetes; calcium-signal modulating cyclophilin ligand; CAML; viral infection; neutrokine alpha polypeptide; TACI-Ligand; TACI-L; cytostatic; therapy; neuroprotective; antidiabetic; antiviral; antiinflammatory; tumour; antiarthritic; antirheumatic; immunosuppressive; multiple sclerosis; rheumatoid arthritis; graft rejection; inflammation; cell proliferation;
                                                                                                                                                                                                                                                                                                                                                      Use of new interactions between tumour necrosis factor receptors (TACI) and TACI ligands to screen candidate molecules for determining agonist and antagonist interactions which are used for treating inflammation -

Novel human multimeric tumour necrosis factor delta or epsilon protein useful for treating disease or disorder of immune system such as autoimmune disease, immunodeficiency, or cancer of immune system -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               well as other disorders, such as viral infection, rheumatoid arthritis, graft rejection, and immunoglobulin (Tg) E-mediated allergic reactions and inflammation. The interaction is used to study.cellular processes associated with tumour necrosis factor (TNF)-receptors such as immune regulation, cell proliferation, cell death and inflammatory responses. The interaction between the extracellular region of TACI and TACI-L can be used to further develop understanding of which cell types TACI-L

                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                             Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC factor (TNF) delta and TNF epsilon proteins, and the polynucleotide
CC sequences encoding them. The proteins are useful for modulating
CC immunoglobulin production or for modulating proliferation of B-cells.
CC The sequences of the invention are useful for treating diseases or
CC diseases (e.g. systemic lupus erythematosus (SLE), acquired
CC diseases (e.g. systemic lupus erythematosus (SLE), acquired
CC (e.g. chronic lymphocytic leukaemia (CLL), multiple myeloma,
CC (e.g. chronic lymphocytic leukaemia (CLL), multiple myeloma,
CC (e.g. chronic lymphocytic leukaemia (CLL), multiple myeloma,
CC (ifections, microbial infections (e.g. viral, bacterial), parasitic
CC infections, nephritis, bone disease (e.g. osteoporosis), atherosclerosis,
CC pain, cardiovascular disorders (e.g. mycardial infarction, stroke),
CC neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson's
CC disease), graft versus host disease, wound healing, haematopoietic cell
Cd diseases or disorders (e.g. alzheimer's disease, Parkinson's
CC diseases or disorders associated with various mucous membranes of the
CC body (e.g. mucositis), and disorders of the pulmonary system. The
CC proteins are also useful as a vaccine adjuvant that enhances immune
CC responsiveness to specific antigens. The present sequence for human
CC (IgG) Fc fusion protein is used in the examples of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

(I) can be used for inhibiting, in a mammal, the activity of a ligand that binds Ztnfr12 (e.g. ZTNF4), for treating disorders and diseases associated with B lymphocytes, activated B lymphocytes or resting B lymphocytes, and for inhibiting the proliferation of tumour cells. (I) is useful for treating autoimmune disorders such as systemic lupus erythematosus, myasthenia gravis, multiple scherosis, insulin dependent diabetes mellitus, asthma, rheumatoid arthritis, bronchitis, emphysema and end stage renal failure or renal disease such as glomerulonephritis, vasculitis, chronic lymphoid and provised and approvide and supplementations, vasculitis, chronic lymphoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       leukaemia, nephritis, and pyelonephritis, and for treating renal meoplasms, multiple myelomas, lymphomas, light chain neuropathy, or amyloidosis, hyperdension, large vessel diseases, graft-versus host disease, graft rejection and Crohn's disease. (I) is useful for modulating the immune system, for regulating B cell responses and development, for modulating development of other cells, antibody production and cytckine production, and for modulating T and B cell communication. The present sequence represents a protein which is given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 07-NOV-2000; 2000U$-246449P.

The invention relates to treating a mammal for a condition associated with undesired cell proliferation (e.g. a solid CC tumour, or reducing the size of a solid tumour located on or in a mammal CC comprising administering a transmembrane activator CAML interactor CC protein (TACI) reagent. The TACI reagent has cytostatic and vulnerary CC cativity. Treating a mammal (e.g. human, cow, horse, dog, mouse, rat or CC cancer such as renal cell cancer, Kaposi's sarcoma, breast cancer, CC sarcoma, ovarian carcinoma, rectal cancer, throat cancer, melanoma, colon cancer, bladder cancer, mastocytoma, lung cancer, mammary adenocarcinoma, CC pharyngeal squamous cell carcinoma, gastrointestinal cancer or stomach CC cancer). The method is also useful for treating cellular cancer). The method is also useful for treating cellular cancer. The TACI reagent of the invention can extend mean survival time of a mammal in the absence of administering the TACI reagent. The TACI reagent also creduces the size of the tumour by 25% or more.

             The invention describes a multimeric human tumour necrosis factor (TNF) cdelta or egsilon protein (I) (I) or a composition containing them (II) care useful for modulating immunoglobulin production or proliferation of B cells. (I) or (II) is useful: for treating a disease or disorder of the immune system, preferably an autoimmunod disease (e.g. Sjogren's syndrome, composition or communodeficiency syndrome (AIDS); an immunodeficiency e.g. acquired immunodeficiency syndrome (AIDS); cancer of the immune system (e.g. Hodgkin's disease, non-Hodgkin's the diagnosis and treatment or prevention of cancer. lymphoproliferative disorder, bacterial and viral infections, osteoporosis, atherosclerosis, pain, cardiovascular disorders (e.g. stroke), allergy, inflammation, currodegenerative disease (e.g. stroke), allergy, inflammation, cardiovascular disease (e.g. stroke), asterosis, septic shock, and contains and contains and contains as a stroke as the second of the sec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HIV; human immunodeficiency virus; autoimmune disease; immunodeficiency; 39ogran's syndrome; systemic lupus erythematosus; Hodgkin's disease; common variable immunodeficiency; CVID; non-Hodgkin's lymphoma; AIDS; acquired immunodeficiency virus; cancer; multiple myeloma; CLL; chronic lymphocytic leukaemia; lymphoproliferative disorder; bacterial infection; viral infection; osteoporosis; atherosclerosis; pain; cardiovascular disorder; stroke; allergy; Alzheimer's disease; neurodegenerative disease; inflammation; liver disease; cirrhosis; cardiomyopathy; diabetes; asthma; psoriasis; glomerulonephritis; unlcerative colitis; angiogenesis; septic shock; wound healing; tumour necrosis factor receptor; TACI; immunoglobulin; IgG.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC protein (BCMA) acthvity in a mammal. The method comprises administering CC a specific binding partner for APRIL (G70, a tumour necrosis factor-TNF CC family ligand), having the consensus region of TACI, BCMA, or the TACI/CC BCMA extracellular consensus sequence, but not the extracellular region CC of TACI or BCMA. The method is useful for inhibiting activity of TACI or BCMA in a mammal which is useful for treating B-cell or T-cell CC lymphoproliferative disorders, one or more solid tumours such as lung, CC gastrointestinal, pancreatic or prostate tumour. APRIL, BCMA and TACI CC anteagonists are useful for treating inflammation and immune function CC diseases such as diarrhoea, psoriasis, allergies, pneumonia, atopic CC dermatitis, respiratory allergic disease (asthma, hypersensitivity lung CC disease), drug and insect sting allergy, inflammatory bowel disease (Crohn's disease, colitis), scleroderma, autohmune disease (miltiple sclerosis, reumatoid arthritis, systemic lupus erythematosus), fungal, CC bacterial, protozoal and viral infections (HIV), atherosclerosis, cancer with leucocyte infiltration of the skin or organs. The present sequence

                                                                                                                                                                           片
                                                                                                                                                                                                                 Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a composition (I) comprising AGP-3 receptor (C (tumour necrosis factor ligand family member) related protein (II) c attached to a vehicle protein. (I) is useful for modulating AGP-3-related CC activity in mesenteric lymph nodes (MIN) of a mammal. (II) is useful in CC related to AGP-3R-related protein and for identifying compounds (C (agonists or antagonists) that interact with AGP-3R proteins. (II) is CC also useful for identifying intracellular proteins that interact with AGP-3R proteins. (II) is CC the respective cytoplasmic domains by yeast two-hybrid screening CC process. (II) is involved in B cell growth, survival and activation particularly in lymph node, spleen, and Peyer's patches. AGP-3R CC agonists and antagonists identified using (II) are used for modulating CC agonists and are used to treat diseases characterised by CC inflammatory processes or deregulated immune response such as CC lupus, etc. (II) is also useful in the production of hybridoma cells which are derived from B cells, which involves treating the hybridoma cells which are derived from B cells, which involves treating the hybridoma cells with (II). (II) is useful in the treatment of inflammatory conditions of joints, e.g., rheumatoid arthritis, osteoarthritis, etc. (C (II), its agonists or antagonists are useful for treating the hybridoma cells cathma, atherosclerosis, cachexia/anorexia, dabetes, fever, injury
                                                                                                                                                                                                                                                                       Matches

This sequence represents the protein of an N-terminus FLAG-tagged human CC full length TACI from pJST552 (FLAG-tagged human APRIL-R2 (a proliferation inducing ligand)). The invention relates to treating a CC mammal for a condition associated with undesired cell proliferation (e.g. a solid tumour, or reducing the size of a solid tumour located on or in a CC mammal) comprising administering a transmembrane activator CAML interactor protein (TACI) reagent. The TACI reagent has cytostatic and CC vulnerary activity. Treating a mammal (e.g. human, cow, horse, dog, CC mouse, rat or cat) for a condition associated with undesired cell CC proliferation (e.g. cancer such as renal cell cancer, Kaposi's sarcoma, CC melanoma, colon cancer, bladder cancer, mastocytoma, lung cancer, mammary CC adenocarionoma, pharyngeal squamous cell carcinoma, gastrointestinal CC cancer or stomach cancer). The method is also useful for treating CC cancer or stomach cancer). The method is also useful for treating CC cancer or stomach cancer). The method is also useful for treating CC cancer or stomach cancer). The method is also useful for treating CC cancer or stomach cancer). The method is also useful for treating CC cancer or stomach cancer). The method is also useful for treating CC cancer or stomach cancer). The method is also useful for treating CC cancer or stomach cancer). The method is also useful for treating CC cancer or stomach cancer). The method is also useful for treating cancer or stomach cancer of administering the invention can extend mean CC and uterine fibrosis. The TACI reagent of the mean survival time of a mammal by 25% as compared to the mean survival time of cancer of administering the TACI reagent. The TACI cancer agent also reduces the size of the tumour by 25% or more.
